

the US (those stories were first reported in early May).

I say that because cybersecurity is a big part of what Verizon Enterprise (as I believe they now go by) sells to its business customers; the infographic above, warning of data breaches when you least expect it (heh), is part of one they use to fear-monger its customers. Energy consumers are one of its target customer bases. And the case studies it describes involve several Smart Grid projects. Precisely the kind of thing the government is most freaked out about right now.

After all, aside from Medicare fraud, the government simply doesn't investigate businesses, ever. Certainly not the kind of banker businesses we'd like them to investigate. One of the few things they investigate business activities for is to see if they've been compromised. Moreover, the Section 215 order requires either a counterintelligence or a counterterrorist nexus, and the government has gone to great lengths to protect large businesses, like HSBC or Chiquita, that have materially supported terrorists.

Anyway, that's all a wildarsed guess, as I said.

Ah well. If the government can use Section 215 orders to investigate all the Muslims in Aurora, CO who were buying haircare products in 2009, I'm sure big business won't mind if the government collects evidence of their crimes in search of Iran or someone similar.

Update: Note, this order seems to show a really interesting organizational detail. This is clearly an FBI order (I'm not sure who, besides the FBI, uses Section 215 anyway). But the FISA Court orders Verizon to turn the data over to the NSC. This seems to suggest that FBI has NSA store and, presumably, do the data analysis, for at least their big telecom collections in investigations. That also means the FBI, which can operate domestically, is getting this for DOD, which has limits on domestic law

enforcement.
